Key Findings

All insights are scored on what each has at stake per year, and the largest are shown here.

01 Reprint Revenue Represents 27.2% of Revenue

Recurring Revenue →

£1.3M

of reprint work is now overdue

27.2% of revenue comes from titles printed before, work where the origination is done and the specification is proven. 292 of those titles are now past their own reprint cycle. Each one is either about to be ordered, about to be ordered somewhere else, or discontinued, highlighting the need for proactive management.

02 Concentration of Value Added Among Key Accounts

Customer Value →

22.5%

CUST_011 and CUST_024 are effectively level at the top

CUST_011 and CUST_024 are effectively level at the top, holding 22.5% of value added. The next account, CUST_041, is significantly smaller at 5.2%. While this concentration allows for efficient service, it poses a notable commercial risk, as losing these accounts could severely impact financial performance.

03 Seasonal Press Load Variability

Demand & Capacity →

3.1×

the difference between peak and trough months

Sep runs at 129% of an average month while Dec runs at 42%. Because the constraint here is press time rather than order count, that swing lands directly on capacity: overtime and outsourcing at the peak, fixed cost against thin work at the trough. Both are expensive, and both are predictable a year ahead.

04 Significant Risk from Customer Churn

Account Retention →

£1.3M

of lifetime value sits with dormant accounts

Customers rarely announce that they are leaving; they simply stop calling. 10 accounts are quieter than their own history would predict, and 5 have effectively stopped. Acting while an account is merely quiet costs far less than winning it back once it has gone.

05 Customers Overdue or Due Soon for Orders

Reorder Forecasting →

19

past their normal gap

Most customers reorder on a rhythm, even when nobody has written it down. 19 accounts are now past the gap they normally leave between orders, and 22 more are due within a fortnight. This signals a potential £536k of work in the next month, allowing us to manage production and resources effectively.

The book by billing currency

CURRENCY	WHAT IT COVERS	NATIVE VALUE	IN GBP
Euro	Total in euros for jobs	13,996,735	£12.0M
Stg	Total in sterling for jobs	15,286,516	£15.3M
Reported total (GBP)	Total value reported in GBP	n/a	£27.3M

Converting all figures to GBP before reporting prevents a £2.0M overstatement of the order book that would occur if currencies were summed raw. This ensures clarity and accuracy in financial reporting, which is crucial for informed decision-making. Mixed-currency totals can confuse stakeholders, and this practice establishes a reliable convention.

Strategies to Mitigate Concentration Risk

01 Identify and develop lower-ranked accounts [FREE: REVIEW THIS REPORT](#)

Focus on growing the accounts just below the top four. This will help diversify revenue without needing to acquire new customers.

02 **Assign ownership to high-value accounts** FREE: TWO MEETINGS

Ensure that CUST_011 and CUST_024 have a dedicated board-visible owner and multiple contacts to reduce dependency on single relationships.

03 **Implement quarterly reviews of key accounts** PLANNING: QUARTERLY REVIEW

Establish a routine to assess the health and growth potential of key accounts, ensuring proactive management.

RECURRING REVENUE

JOB_02176	CUST_012	Brochures / Price List	2	417 days	450 days	£12,230

Focus on reprint opportunities now.

01 Implement a weekly review of overdue titles. FREE: SALES BEHAVIOUR

This is the easiest revenue in the business and it is currently left to chance. A weekly call against titles past their cycle converts guesswork into a repeatable sales motion.

02 **Prioritise calls on titles overdue for reprint.** **PLANNING: USES IDLE CAPACITY**

Reprints are among the few jobs where timing is genuinely negotiable. Pulling them forward into a slow week fills capacity that is otherwise paid for and standing idle.

03 **Monitor competitor activity on recurring titles.** **WATCH: MARKET DYNAMICS**

A competitor only needs the specification the customer already holds to quote against you. Getting there first, with a price and a slot, is usually enough to keep the work without discounting for it.

REORDER FORECASTING

Customers Overdue or Due Soon for Orders

OVERDUE NOW

19

customers are overdue an order

DUE WITHIN 14 DAYS

22

on their usual rhythm

EXPECTED NEXT 30 DAYS

£536k

based on recent order values

KEY FINDING

19

past their normal gap

Most customers reorder on a rhythm, even when nobody has written it down. 19 accounts are now past the gap they normally leave between orders, and 22 more are due within a fortnight. This signals a potential £536k of work in the next month, allowing us to manage production and resources effectively.

The order book by readiness

Immediate steps to reduce churn

01 Contact at-risk customers this week. FREE: SALES CALL

These customers have not left; they have gone quiet. A single call asking whether anything has changed will usually reveal whether it is a pause, a budget issue, or a competitor, while there is still time to respond.

02 Launch a win-back campaign for dormant accounts. FREE: ALREADY BUILT IN

Dormant accounts need more than routine follow-up. Give the list a budget, a specific offer, and a deadline, and treat the response rate as the measure of whether win-back is worth repeating.

03 Monitor customer engagement patterns closely. NONE

Six weeks of quiet from a fortnightly customer is a warning; the same six weeks from a twice-a-year customer means nothing. A single company-wide threshold would raise false alarms on one and miss the other entirely.

High Override Rate in Pricing Decisions

QUOTES OVERRIDDEN

98.4%

Of all jobs priced

PRICE REDUCTIONS

£759k

Given away over the period

JOBS BELOW COST

278

£225k of lost value

KEY FINDING

98.4%

of quotes leave at a price the system did not set

The estimating system calculates a price, and on 98.4% of jobs somebody changes it before the quote goes out. Reductions of £759k are almost exactly offset by uplifts of £808k. This indicates that pricing is heavily influenced by individual judgement rather than consistent rules, which can lead to variability in profitability.

Where the money moves at quoting stage

CATEGORY	WHAT IT MEANS	AMOUNT	SHARE OF SALES
Price reductions	Given away over the period	£759k	2.8%
Price uplifts	Offsetting reductions by estimators	£808k	3.0%
Jobs below cost	Losses from unprofitable jobs	-£225k	278 jobs
Low-margin work	Jobs with less profit	£1.1M	10.5% of jobs

Where discounting concentrates

Total price reductions by account

Discounting by sales rep

A coaching conversation, not a league table, since territories differ in size and mix

Discounting by type of work

Reductions measured against each category's own sales, so a large category is not flagged simply for being large

WORK TYPE	JOBS DISCOUNTED	TOTAL JOBS	REDUCTIONS	% OF CATEGORY SALES
Litho	1,915	4,388	£637,219	2.44%
Outwork	203	474	£61,801	11.05%
Digital	817	1,354	£59,346	10.68%
Wide Format	70	139	£966	1.31%

Accounts carrying below-cost work

Some of these will be genuine loss-makers, some credit notes or mis-bookings. Establishing which is the point of the list.

CUSTOMER	JOBS BELOW COST	VALUE ADDED	SELL PRICE OF THOSE JOBS
CUST_024	64	-£133,827	£58
CUST_007	9	-£20,930	£6,727
CUST_041	12	-£13,203	£0
CUST_046	1	-£12,920	-£12,920
CUST_028	3	-£8,022	-£8,022
CUST_030	6	-£4,195	-£525
CUST_045	4	-£3,676	£1,164
CUST_005	16	-£3,272	£2,678
CUST_012	21	-£2,995	£970
CUST_050	2	-£2,841	£0
CUST_039	1	-£2,711	£9,100
CUST_023	3	-£2,283	£0

Steps to Improve Pricing Consistency

01 Feed override data back into pricing rules. PROJECT: HIGH PAYBACK

A calculated price that needs changing on 98.4% of jobs is not doing its job. Feed the last two years of overrides back into the pricing rules so the default lands closer to what estimators actually charge.

02 Set a signature requirement for large discounts. FREE: POLICY DECISION

CUST_024 absorbed £194k of reductions. Set a level beyond which a price cut needs a second signature to ensure larger discounts are deliberate.

03 Investigate jobs below cost. PROJECT: HIGH PAYBACK

Some of these will be genuine loss-makers, so start by analysing the 278 jobs below cost. 60% of the value sits on CUST_024, which should be prioritised.

Seasonal Press Load Variability

BUSIEST MONTH

Sep

of an average month

QUIETEST MONTH

Dec

of an average month

NEXT MONTH PROJECTED

£942k

583 press hours

KEY FINDING

3.1×

the difference between peak and trough months

Sep runs at 129% of an average month while Dec runs at 42%. Because the constraint here is press time rather than order count, that swing lands directly on capacity: overtime and outsourcing at the peak, fixed cost against thin work at the trough. Both are expensive, and both are predictable a year ahead.

Planning implications by season

PERIOD	WHAT IT MEANS FOR THE PLANT	LEVEL	PRIORITY
Peak (Sep)	Maximum demand expected this month	129%	Book capacity early
Trough (Dec)	Lowest demand expected this month	42%	Schedule maintenance
Recent press load	Current operational baseline capacity	477 hrs	Baseline
Peak press load	Highest capacity limit achievable	694 hrs	Capacity ceiling

Booked sales by month, with projection

Sales in the busiest month by customer sector

Immediate planning steps

- 01

Book capacity for September.

FREE: PLANNING DECISION

Anticipate high demand and secure necessary resources in advance to meet the increased workload.
- 02

Schedule maintenance for December.

FREE: RESCHEDULE EXISTING WORK

Utilise the quiet month for essential maintenance to avoid disruptions during peak periods.
- 03

Focus sales efforts on off-peak customers.

CAMPAIGN: FILLS FIXED COST

Target customers with quieter cycles to maximise use of idle capacity and improve profitability.

PRODUCTION TURNAROUND

Turnaround Time Needs Attention

TYPICAL TURNAROUND

18 days

Half of all jobs ship within this

SLOWEST TENTH

63 days

Or longer, where complaints come from

RECENT TREND

+1.7 days

Turnaround has slipped

KEY FINDING

18 days

is the typical turnaround from order to despatch.

Half of all work ships within 18 days, but the slowest tenth takes 63 days or more. This discrepancy affects customer satisfaction and can lead to complaints. Turnaround has slipped by +1.7 days recently, indicating a need for process review to prevent further delays.

Turnaround by production route

WORK TYPE	WHY IT TAKES THIS LONG	MEDIAN	SLOWEST TENTH
Digital	Fast turnaround for digital jobs	6 days	18 days
Wide Format	Slightly longer for wide format	7 days	15 days
Outwork	Outwork jobs take significantly longer	10 days	55 days
Litho	Litho jobs have the longest turnaround	25 days	67 days

Turnaround by type of work

Median days from booking to despatch

Slowest products

Products with enough volume to be meaningful

Is turnaround improving or slipping?

Median days to despatch, month by month

Jobs that ran far beyond their product's norm

Ranked by how far past the usual turnaround for that same product they went. This is where recoverable time sits

JOB	CUSTOMER	PRODUCT	TOOK	OVER THE NORM	SELL PRICE
JOB_03316	CUST_013	Books/Educational Books	176 days	+169 days	£647

Steps to Improve Turnaround

01 Change the KPI for turnaround metrics. FREE: CHANGE THE KPI

Align KPIs with product-specific turnaround times to set realistic expectations for customers. This clarity can help in managing commitments.

02 Review exceptions causing delays. FREE: EXCEPTION REVIEW

Identify and address the reasons for delays in the slowest tenth. This can help reduce expedite costs and improve customer satisfaction.

03 Establish a policy for turnaround commitments. FREE: POLICY DECISION

Implement a policy that clearly defines turnaround times per product type. This will help manage customer expectations and improve overall service.

QUOTE INTELLIGENCE

Margin Protection Through Quoting Insight

TYPICAL ACCURACY

6.7%

Error on jobs never seen

WITHIN 25%

91.5%

Of held-out jobs predicted

UNDERPRICED JOBS FOUND

77

Worth £88k of gap

KEY FINDING

6.7%

for jobs never seen by the model.

The model achieves a typical error of 6.7% on jobs it has never seen, providing estimators with a reliable reference point for pricing. With 91.5% of jobs predicted falling within 25% of actual sales, this tool can protect margins at the quoting stage. Identifying 77 underpriced jobs signals £88k of potential revenue loss, which should be addressed proactively.

How the benchmark was tested

MEASURE	WHAT IT MEANS	RESULT	READ
Typical error	Typical error when predicting a job's price	6.7%	Good
Within 10%	Percentage of predictions within 10% accuracy	64.4%	Usable as a guide
Within 25%	Percentage of predictions within 25% accuracy	91.5%	Strong
Tested on	Number of jobs used for testing	1,533 jobs	Honest measure

Steps to Enhance Quoting Process

- 01

Integrate the model into quoting software.

INTEGRATION: HIGHEST VALUE

Incorporate the model directly into estimating tools to provide real-time pricing comparisons. This ensures estimators have accurate data at their fingertips, improving margin protection.
- 02

Flag underpriced jobs for review.

FREE: ROLLOUT DECISION

Establish a monthly review of the 77 underpriced jobs identified. This allows the team to understand pricing drift and make informed decisions on pricing strategies moving forward.
- 03

Display model predictions alongside calculated prices.

SHOW COMPARISON

Present the model's pricing predictions alongside the calculated price during quoting. This gives estimators a second opinion without undermining their judgement, enhancing overall pricing accuracy.

What the model looks at

Value added, markup and the manual price adjustment are deliberately excluded, because they are consequences of the pricing decision, not inputs to it. Including them would let the model reconstruct the answer and report an accuracy it has not earned.
